Garnsh — Business Plan

v2.1 · 9 November 2026 · financials rebuilt on a 36-month monthly cash model (§10)

Prepared: November 7, 2026 Status: Draft v2 — merges the founders' plan v1 (control thesis, verified market research) with the independent review draft v1.1 (risk apparatus, conservative case). Every number that is an assumption is labeled as one. Verified market facts are sourced at the end.

1. Executive summary

Garnsh is a software-as-a-service (SaaS) product for restaurant groups that run Toast point of sale (POS). It is built on one observation about enterprise restaurant groups: they keep their digital sales channel in their own hands, not Toast's. They run Toast gladly as the system of record — POS, payments, kitchen, reporting — but they want their own website, their own ordering experience, and their own guest relationship. Toast offers them templates inside Toast's properties instead, and offers no open application programming interface (API) to connect a Toast menu to a website of their own. So the connection gets built by hand, and the menu guests see drifts away from the menu in Toast: prices change and the website keeps the old PDF; a location 86s an item and the QR menu still shows it; the airport location's prices end up on the flagship's menu board.

Garnsh is the layer that closes that gap. It takes the menu the team already maintains in Toast and publishes branded, per-location versions of it everywhere guests read it: the group's own website (embed) or a hosted page, QR menus, and in-store menu boards — with preview-before-publish, version history, rollback, and a last-known-good fallback so a bad sync never leaves a blank board during service. The wedge is menu release discipline: Garnsh treats a menu the way engineering treats a deploy — draft, preview, publish, rollback, with an audit trail.

The plan in one paragraph: Two partners capitalize the company with $10,000 each ($20,000 paid-in, January 2027). Generation 1.0 (2027) ships menu publishing — custom menus, order-ready menu boards, custom location picker — and signs 10 showcase restaurant groups (10+ locations each) in the first half of the year. The Toast partner application is submitted in week one, because Generation 2.0 (2028) — custom online ordering on the group's own website — requires full Toast partner certification, and that clock is the company's critical path. Generation 3.0 (2029) adds a custom branded mobile app and e-commerce. Base-case scenario: ~15 groups / ~210 locations by end of 2027, ~46 groups / ~640 locations by end of 2028, ~92 groups / ~1,250 locations by end of 2029. A conservative case (slower signings, no app revenue) is modeled in §10 alongside it — roughly $661K exit annual recurring revenue (ARR) by year three. On either case the business is cash-lean and founder-built; the conservative case is still a profitable niche business, not a failure.

The single biggest risk is not competition — it is Toast itself: partner approval, marketplace economics, and Toast shipping this natively. Section 7 treats that dependency as the critical path, with a hard decision gate at day 120. Section 14 sets kill criteria in advance, in writing.

2. The problem

The problem is control. A restaurant group's digital front door — its website, its online ordering, and the guest relationship that flows through both — is the most valuable sales channel it owns. Enterprise groups know this, and most of them keep that channel in their own hands, not Toast's. They run Toast because it is an excellent system of record: POS, payments, kitchen, reporting. They do not want Toast's templates as

their brand’s public face, Toast’s modules as their ordering experience, or their guest relationship living inside Toast’s properties instead of their own. Toast is the engine. They want to own the storefront.

That choice creates a structural gap, because Toast’s architecture assumes the opposite — that the guest-facing layer also lives inside Toast:

Why Toast’s own answer doesn’t fit enterprise groups

Toast Websites is a template site builder aimed at operators who need a website, not groups with brand teams, agencies, and existing web properties. Its menu channel is literally called “Websites View-Only” — the menu appears on your Toast Website, view only, not orderable (Toast’s own support documentation). A group with its own site gets nothing from this.

Toast Online Ordering runs on Toast’s pages, in Toast’s frame, with limited customization — and the menu cannot even differ between Toast Online Ordering and the Toast Local app (Toast support documentation). The guest experience, the checkout flow, and the customer relationship belong to the platform, not the brand.

So enterprise groups do what the platform doesn’t plan for: they keep their own websites and their own ordering ambitions, and the connection between Toast and those properties has to be built by someone else — or maintained by hand.

The API wall (verified against public sources)

The obvious fix — “just connect the Toast menu to our website with an API” — does not exist as an open option:

Toast’s Menus API is real but partner-gated. The documentation is public; the credentials are not. Production API access is issued only to vendors accepted into Toast’s partner program after vetting, a signed agreement, and certification. As one 2026 industry guide puts it: “Anyone can read the docs. Almost no one can call the API.” There is no self-serve public API that a restaurant or its web developer can use to publish the Toast menu to the group’s own website.

The one self-serve door is not a website door. Toast’s “standard API access” lets a restaurant pull its own data, read-only (GET requests only, and only the older Menus V2), and Toast positions it for reporting and internal use. It requires a Restaurant Management Suite Essentials subscription per location, every request targets a single location, and it can never write anything — no orders, ever. It is a reporting tool for a group’s own analysts, not a supported way to power a public website, and it does not work as a publishing pipeline across dozens of locations.

Writing is fully locked. Anything that creates data in Toast — above all, injecting online orders from a group’s own ordering front-end — is reserved to certified partners. A group that wants its own ordering experience flowing into Toast can only get there through a partner’s product, or by becoming one.

The practical result: the menu on a group’s own website gets maintained manually, by export, by scraping workarounds, or on an agency retainer — and the group’s ordering ambitions wait on a short list of expensive enterprise platforms (see §6).

What guests actually see

Meanwhile the group runs one operational menu (in Toast) and presents it in at least four places: their website, third-party and QR menus, in-store boards/screens, and printed pieces. Each surface is maintained separately, usually by hand, usually by someone whose real job is running restaurants.

The failure modes are constant and visible to guests:

Price drift — Toast says $16.25, the website PDF says $14.50. A guest who sees $16 on the QR menu and is charged $18 is a comp, a bad review, and in some jurisdictions a consumer-protection exposure.

Dead items — discontinued or out-of-stock items still displayed and ordered around.

Wrong-location menus — one location's pricing or items shown at another.

Stale PDFs — the website menu is a PDF from two menu cycles ago because updating it means calling the web person — and when that person quits, the knowledge leaves with them.

No safety net — a broken integration or a bad publish leaves a blank board or an error page during service.

For a 10+ location group, this is not a cosmetic issue. It is hundreds of small guest-facing errors per week, multiplied by every surface, with no single person able to fix them at the source.

3. The product

Positioning line (from the live site): "Your menu, everywhere. Get more from the menu you already run in Toast."

Generation 1.0 — 2027: Menu publishing

Custom menus — the Toast menu rendered on the group's own website (embed) or on a Garnsh-hosted page per location, styled to the brand.

Custom order-ready menu boards — designed displays for in-store screens, fed from the same source menu.

Custom location picker — each surface mapped to the correct location's menu and prices.

QR menus — per-location phone view opened by a printed code.

Publishing controls — preview every surface before publishing, deliberate publish (not silent auto-sync), full version history, one-click rollback, and last-known-good serving if anything upstream breaks.

A non-API bridge, shipped on purpose — CSV/Google Sheets import plus a manual editor, so the first groups can go live and pay before any Toast approval lands (see §7). It is a bridge, not the product.

Generation 2.0 — 2028: Custom online ordering

A branded ordering front-end on the group's own website — their domain, their design, their guest relationship — with orders written into Toast through the certified partner Orders API. This is the product enterprise groups actually ask for (see §2), and it is the plan's prize: it is also where the money and the platform risk both concentrate, so it is gated on ordering-partner certification (see §7).

Scope guardrail: Gen 2 is built on Toast's partner ordering rails wherever the certification allows, so card handling stays with Toast. Owning checkout outright — Garnsh's own cart, payments, refunds, sales-tax and tip logic — is a separate, later decision (2029 at the earliest, and only under a signed partnership that makes it safe), because it changes the company's regulatory identity (PCI DSS scope, chargeback handling, support measured in minutes) and puts Garnsh head-on against Toast's core revenue. The distinction matters: order injection by certified partners is a sanctioned Toast category — ChowNow, Lunchbox, and Olo do it for a living. It is gated and expensive, not forbidden.

Generation 3.0 — 2029: Owned guest channels

Custom branded mobile app per group.

Custom e-commerce — merchandise, gift products, packaged goods under the group's brand.

Kept as vision funded from revenue, not as a dated commitment: branded-app install rates collapse below ~25 locations, so Gen 3 sells only to the top of the base.

What Garnsh is not

Not a POS, not a delivery network, not a marketplace.

Not affiliated with or endorsed by Toast (the site already states this correctly — keep that disclaimer everywhere).

Honest product debt

The current build is a strong demo with real interaction design. To be sellable it needs: a real ingestion path (§7), tenant authentication and isolation, per-location asset management, an upload pipeline for logos/fonts, board scheduling, and an accessibility pass to WCAG 2.1 AA (Web Content Accessibility Guidelines). Budget roughly 8–12 weeks of focused work — it is a quarter, not a weekend, and the Q1 2027 plan is sized to it.

4. Target customer

Ideal customer profile (ICP): restaurant groups with 10+ locations, all on Toast, with a brand worth protecting — regional fast-casual and casual-dining groups, multi-unit franchisees, and growing concepts in the 10–50 location band. The roadmap evolves the target to 25+ location groups as the ordering and app generations land.

Why this segment: - Below 10 locations, the pain is real but the budget and the brand risk are small; a single-location operator tolerates a stale PDF. - At 10+ locations, menu inconsistency is a brand and revenue problem with an owner — usually a small marketing/ops team that currently copy-pastes menus for a living. - Groups standardize on one POS, so one integration (Toast) covers the whole estate in a single sale. One signature = 10–50 locations of recurring revenue. - Multi-unit accounts churn at roughly 1–1.5% per month versus 4%+ for independents, because switching means re-mapping every location.

Buyer: VP of Marketing, Director of Operations, or the founder-operator in smaller groups. The pitch is operational (“your menus are wrong in public, and your ordering runs on someone else’s pages — here is your storefront back”), not technical.

An open strategic question, stated honestly (decision §15.6): the review draft argued the opposite growth direction — that growth comes from adding POS platforms (Square, Clover, Lightspeed) and moving down into 3–9 location groups once onboarding is self-serve, because chasing ever-bigger accounts brings enterprise incumbents and 6–9 month cycles a two-person company cannot service. This plan keeps the founders’ 10+ → 25+ direction for 2027 (it matches where the control pain and the budgets are), adopts multi-POS as a year-two hedge (§7), and leaves the down-market question to be decided with real churn and sales-cycle data in hand — not by assertion in either draft.

5. Market

Verified facts (Toast’s own reporting, Q3 2026): - Toast runs approximately 189,000 locations, up 21% year over year, with annualized recurring revenue of $2.5 billion as of September 30, 2026. It added ~8,500 net new locations in Q3 2026 alone, including enterprise wins like an 800-location bagel group — evidence Toast is pushing upmarket into exactly Garnsh’s target segment. - Toast itself estimates its US restaurant locations are about 20% of the US restaurant market, and the US has well over 700,000 eating and drinking establishments.

Sizing (assumption-driven — no public source breaks out Toast locations by group size): - Assumption: 10–20% of Toast’s 189,000 locations sit in groups of 10+. That is a serviceable addressable market (SAM) of roughly 19,000–38,000 locations. - At a blended $89 per location per month, that SAM is worth roughly $20M–$40M in annual recurring revenue for the menu-publishing layer alone, before ordering and app revenue. - Conservative cross-check (from the review draft): at 8–12% of the base in 10+ groups (15,000–23,000 locations) and $48–$61 blended, the same slice is worth $8M–$17M ARR. The truth is inside that range and cannot be resolved from public data — plan capital against the conservative end and sell against the optimistic one. - Serviceable obtainable market (SOM) for this plan: ~1,250 locations by end of 2029 in the base case (~900 in the conservative case) — roughly 3–6% of the assumed SAM. Ambitious but not fantasy, if the showcase cohort converts (see §9).

Why now: menu data is becoming a discovery asset (search engines and AI answer engines reward current, structured, machine-readable menu pages; a PDF is invisible to them); digital signage hardware is cheap, so the bottleneck is software; restaurant labor turnover keeps recreating the “person who knew how to update it” failure; and Toast’s base compounds by ~8,500 locations a quarter without Garnsh spending a dollar.

6. Competition

Competitor	What they sell	Price signals (published, Oct 2026)	Garnsh's opening
Toast native (Websites, Online Ordering, Delphi boards)	Bundled website + ordering inside Toast; Delphi digital menu boards on Toast's hardware track	Bundled with POS plans	Generic templates, limited brand fidelity; menus shown on Toast properties, not the group's; publishing discipline (versioning, rollback, per-location control) is not the product's focus
Lunchbox	Enterprise direct ordering, apps, loyalty	~$300–$499/mo per location per product (enterprise)	Ordering-first and expensive; menu display treated as plumbing. Garnsh Gen 1 undercuts on price and wins on publishing craft — Gen 2 is where they collide
ChowNow	Commission-free ordering for independents	$229–$449/mo per location + setup	Built for single/few-location independents; weak multi-location central management
Popmenu	Website + marketing + ordering add-on	$159–$499/mo per location	Marketing suite first; menu accuracy/ publishing controls are not the core claim
Owner.com	Website + ordering + marketing bundle	$249/mo + 5% per order, or $499 flat	Aimed at independents; per-order fees groups dislike
Marqii	Menu sync out to Google/ Yelp/Apple/Facebook	Mid-market, unpublished	Distribution, not rendering. A natural partner (and plausible acquirer), not a direct rival
BentoBox	Restaurant websites + ordering	Not published; now Clover-only	Its move under Clover leaves the Toast-side website/menu gap open — a real opening for Garnsh
Agencies / freelancers	Hand-built sites, manual menu updates	Project fees + retainers	The actual incumbent. Slow, manual, and the reason menus go stale — Garnsh sells the automation they can't; also a reseller channel (§9)

Moat, honestly stated: there is no deep technical moat in reading a menu API — this is a well-executed product with good design taste, and the plan should not pretend otherwise. The defensible assets are (1) publishing craft — versioning, rollback, last-known-good, per-location mapping done better than anyone; (2) switching cost once every location is mapped and opening procedures reference Garnsh; (3) showcase-group logos and case studies in a relationship-driven industry; (4) Toast partner certification and marketplace presence (Gen 2), a real barrier because the process is slow; and (5) the multi-POS adapter layer once built. None of these is strong on day one. All of them compound. Speed and distribution matter more than features.

7. Technology and the Toast dependency (critical path)

This is the section the whole plan hinges on. Toast runs a closed partner ecosystem: documentation is public, but production credentials for multi-restaurant access are issued only to accepted partners. The

published partner path has roughly eight stages — application, vetting, signed partnership agreement, build against sandbox, certification review, alpha at one restaurant, beta at three to five locations for several weeks, then listing in Toast Partner Connect (the marketplace inside Toast). Partner fees are not published; trade reporting from 2019 put Toast's revenue share for ordering partners around 30% — dated, and must be re-verified with Toast directly before Gen 2 pricing is finalized. If a revenue share anywhere near that level applies to Garnsh's tiers, it compresses margin rather than killing viability — but it changes pricing, so it must be known before scaling, not after.

The access ladder, matched to the roadmap:

Week one, January 2027 — apply. The partner application is the longest-lead item in the company and it is absent from the founders' original timeline. Submit it in the first week, before the product is finished; the application is about business case, not code. Every week of delay is a week added to Gen 2.

2027 (Gen 1 — read-only): Menu display needs menu reads, not order writes. Toast's standard API access (included with its Restaurant Management Suite Essentials plan) gives a restaurant read-only credentials to its own data. For pilots and showcase groups, Garnsh connects per-group with the group's own credentials — no partner program required to start selling. The CSV/Sheets import bridge (§3) covers groups where even that is slow. This is the fastest legal path to revenue.

Day-120 gate (~May 2027): if partner approval is not in hand or clearly in process with a named path by day 120, redirect effort to the multi-POS + import path (item 5) or stop. Do not spend a year building a Toast-dependent company without Toast's blessing. (Kill criteria, §14.)

2028 (Gen 2 — ordering): Order injection requires ordering-partner certification. Gen 2's launch date is therefore not fully in Garnsh's control; certification is a 2027 workstream with a 2028 launch target, the alpha/beta stages map naturally onto the showcase cohort (1 alpha location, then 3–5 beta locations), and Gen 1 revenue must be able to carry the company if certification slips. Never pre-sell an ordering date.

The hedge — POS-agnostic by construction: the internal model is "menu document in, surfaces out." Toast is an adapter, not the architecture. That costs about a week now and saves the company later. Target a second POS adapter (Square first, then Clover) by around month 18, so a Toast reversal degrades the business instead of ending it.

Architecture implications: Garnsh's own stack is deliberately boring — a menu ingestion/sync service, a publishing/versioning layer, and four renderers (hosted page, website embed, QR view, board display). The hard engineering is not rendering; it is menu-data hygiene (modifiers, pricing tiers, location variants) and publishing safety. Budget accordingly.

8. Pricing (proposed — to be validated in Q1 2027)

The founders' notes leave pricing open ("finalize pricing" is a Q1 2027 task). This is a proposal built from competitor benchmarks — per-location SaaS in this category runs $119–$499/month, with ordering platforms at the top. Garnsh Gen 1 is a narrower product, so it prices under them and expands wallet share as Gen 2/3 land.

Item	Proposed price	Notes
Onboarding / setup	$1,500 per brand	Brand template build, location mapping, screen setup — covers ~2 hours per location, which is break-even (§10.1). Waived for the 10 showcase groups in exchange for logo use, case study, and testimonial
Core publishing (hosted page, embed, QR)	$59 / location / month	The entry product
Menu boards add-on	+$40 / location / month	Per location running boards
Multi-location management	Included at 10+ locations	Location picker, per-location overrides, group dashboard
Gen 2 ordering module (2028)	+$99 / location / month	Deliberately under Lunchbox's $300–499 enterprise benchmark for the same control; revisit after Toast partner terms (any revenue share) are known
Gen 3 branded app (2029)	$5,000 build + $149 / location / month	Premium tier for 25+ groups
Enterprise (25+ locations)	Custom, ~$119 / location / month all-in	Annual contract, SLA, priority support

Two pricing rules (from the review draft, adopted): 1. Never discount the per-location price. Discount implementation instead — waive setup, add months. The per-location price is the entire revenue model; a discounted rate compounds forever. 2. Charge per location, not per surface. Surface-count pricing invites the operator to turn things off. Location pricing aligns with how operators think and grows automatically when they open a unit.

Alternative considered: the review draft proposed lower tiers ($39 Solo / $69 Growth / $45 Multi at 3+ locations). This plan holds the $59 core because the product is sold on control and publishing discipline to 10+ groups, not on being the cheapest menu page — but pricing is explicitly a validation task (§15.4), and if three friendly operators balk at $59, the draft's ladder is the fallback.

Model assumptions used in §10, shown as a build rather than asserted: blended revenue per location per month of $61 in 2027 (core $59 + boards at 5% attach), $98 in 2028 (boards 55%, ordering 17%), $118 in 2029 (boards 65%, ordering 28%, app 3.5%). **Every price and attach rate in this table is a founder assumption. None of it has been tested against a real invoice.** The Q1 2027 validation task (§15) is to put these numbers in front of ten operators and find out which one they laugh at.

9. Go-to-market

Phase 1 — Showcase cohort (Mar–Jun 2027). Sign 10 groups at 10+ locations on waived setup and discounted year-one pricing, in exchange for: logo rights, a written case study, one reference call per quarter, and product feedback access. These groups are the sales force — restaurant operators buy what peer operators show them. Target pipeline math: at a realistic 1-in-4 close rate on qualified conversations, 10 signatures require ~40 serious group conversations starting January 2027. Build that list in Q1 (Toast-heavy regional groups, franchise expos, operator communities, warm intros through the founders' restaurant networks — including the Afro Deli franchise system the founding team already operates in).

Amendment from the review draft, adopted: at least 6 of the 10 showcase groups pay a real subscription, even at a discount. A free showcase customer is a favour, not validation, and cannot prove willingness to pay. What is traded for the discount is the public case study and the logo — not the invoice.

Note on dates: the founders' notes say "March–June 2026" for this phase. That date is in the past; this plan assumes 2027 and the notes should be corrected.

Phase 2 — Proof to pipeline (H2 2027). Publish the showcase results (menu-error reduction, update time saved, before/after brand screenshots). Convert showcase groups to full price at renewal. Run certification alpha/beta inside the showcase base.

Phase 2b — Agency and reseller channel (from month ~2). Web-design agencies serving restaurants are the highest-leverage channel available: they get asked "can you also update our menu?" constantly, they hate doing it, and they can white-label Garnsh. Offer ~25% recurring revenue share. Twenty active agency partners beat 2,000 organic visitors. POS resellers and state restaurant associations are slower but similarly CAC-efficient (customer acquisition cost). Explicitly not doing: paid search ads (CAC exceeds lifetime value at these price points), cold outbound at scale, trade-show booths.

Phase 3 — Marketplace and ordering (2028). Partner Connect listing becomes a distribution channel Toast itself surfaces to its 189,000 locations. Gen 2 ordering launches to the installed base first (land-and-expand: publishing customers buy ordering at a far higher rate than cold prospects).

Phase 4 — Enterprise (2029). 25+ location groups, branded apps, annual enterprise contracts, presence at the industry shows where those groups buy (National Restaurant Association Show, MURTEC, franchise conventions).

Sales motion, all phases: the deal is won on a live pilot on two locations — a 20-minute demo with the operator's own menu, a 30-day pilot, then conversion on annual terms. Keep the cycle to 21–30 days; if it runs longer, the account is too big for the current product.

10. Financials

Every figure in this section comes from a 36-month monthly model (`model.py`, cash basis, January 2027 – December 2029). The model is the source of truth, not this prose: change an assumption there and every table here — and the deck — moves with it. All figures are founder assumptions. Pricing is validated only by the Q1 2027 conversations; the ramp is a plan, not a forecast.

10.1 Unit economics — the engine under everything

The price is $59 per location per month for publishing, plus $40 for menu boards. Blended revenue per location is that price stack multiplied by attach rates, nothing else.

Revenue per location per month	**2027**	**2028**	**2029**
Core publishing — $59 × 100%	$59	$59	$59
Menu boards — $40 × attach rate	$2 (5%)	$22 (55%)	$26 (65%)
Gen 2 ordering — $99 × attach rate	—	$17 (17%)	$28 (28%)
Gen 3 app — $149 × attach rate	—	—	$5 (3.5%)
Blended ARPU	**$61**	**$98**	**$118**

Boards attach at almost nothing in 2027 because the first cohort is buying publishing to fix a specific problem, not screens. The ordering attach rate (17% of the installed base in Gen 2's first year) is

deliberately conservative — it is the one number that depends on Toast, and it should not be load-bearing in year one.

Cost to serve, per location per month:

	2027	2028	2029
Infrastructure, CDN, image processing	$1.70	$1.70	$1.70
Payment processing (2.9% of revenue)	$1.77	$2.84	$3.42
Support labour, allocated	$4.67	$5.88	$7.94
Onboarding labour, one-time, amortized	—	$8.75	$5.82
Fully loaded gross margin	**86.8%**	**80.5%**	**83.9%**

Two honest notes on that table. First, the **software** gross margin is ~95%; the fully loaded number is lower because support and onboarding are real people. We report the fully loaded number because it is the one that pays salaries. Second, 2027 carries no onboarding labour cost only because the founders do it unpaid — that is a cash margin, not an economic one. The margin dips in 2028 as contracted onboarding absorbs 31 new groups, then recovers as templated onboarding and self-serve replace hours. If it does not recover past 85% by 2030, the business is a services company with a software veneer, and it should be priced and staffed accordingly.

Lifetime value and acquisition cost. Recurring gross margin (excluding one-time onboarding) is 89%. That is the right basis for LTV, because onboarding does not recur.

	Multi-unit group	Single location
ARPU per month	$98 (2028 blend)	$59
Recurring gross margin	89%	89%
Monthly logo churn	1.5%	3.5%
Average life	~67 months	~29 months
LTV	**~$5,830**	**~$1,500**
CAC, fully loaded	$1,200	$150
Payback, including $120 onboarding per location	~15 months	~5 months
LTV : CAC	**~4.9x**	**~10x**

CAC on a group is not a marketing line item; it is mostly founder time. The $1,200 assumes roughly 18 hours of selling and onboarding per closed group at $55/hour fully loaded, plus $600 of travel or event cost, at a one-in-four close rate on qualified conversations. If the close rate is one in six, CAC becomes $1,800 and LTV:CAC falls to 3.3x — still investable, but that is the number to watch, not the marketing budget.

The setup fee is not a profit centre, and barely a cost centre. Onboarding runs about two hours per location at $60/hour = $120 per location. A 12-location brand therefore costs ~$1,440 to onboard against a $1,500 setup fee: $60 of gross margin. At three hours per location it flips to −$660 per brand. Two rules follow: cap onboarding at two hours per location, or raise setup to $2,500. The model holds $1,500 and the two-hour cap. Raising setup to $2,500 adds $31K of revenue in 2028 and $46K in 2029 without changing a single other assumption — it is the cheapest improvement available, and it is a Q1 decision.

Break-even is earlier than the plan previously claimed. At $61 ARPU and 87% margin, running costs are covered at **22 paying locations** with founders unpaid and no support contractor, **70 locations** once a $2,750/month support contractor is on payroll, and **239 locations** if both founders pay themselves $75K.

The last number is the one that matters for whether this becomes a business that outlives the founders' patience. The first number is why the $20,000 works.

10.2 Base case — 2027, month by month

The year-end number is the flattering one. The month that matters is May.

Month	Locations	Revenue	COGS	Gross profit	Operating costs	Net	Cash
Jan	0	$0	$0	$0	$4,617	−$4,617	$15,383
Feb	0	$0	$0	$0	$5,617	−$5,617	$9,766
Mar	6	$0	$5	−$5	$2,916	−$2,921	$6,845
Apr	14	$480	$31	$449	$1,250	−$801	$6,044
May	**32**	**$1,150**	**$72**	**$1,078**	**$1,250**	**−$172**	**$5,872**
Jun	58	$2,340	$144	$2,196	$1,400	$796	$6,667
Jul	82	$3,850	$231	$3,619	$1,250	$2,369	$9,037
Aug	104	$5,301	$312	$4,989	$750	$4,239	$13,276
Sep	126	$10,015	$486	$9,529	$4,950	$4,579	$17,855
Oct	152	$8,479	$1,982	$6,497	$750	$5,747	$23,602
Nov	180	$14,626	$2,206	$12,420	$1,950	$10,470	$34,071
Dec	210	$11,895	$2,176	$9,719	$750	$8,969	$43,040

What this table actually says.

1. **You never spend $20,000 in 2027. You spend $14,128 of it by May, and revenue takes over from June.** The trough is the number that decides whether the company exists; the year-end cash of $43K is a consequence, not an achievement.
2. **The trough is caused by front-loaded spend, not by a slow sales ramp.** Design ($5,000 across three milestone payments), legal ($2,500), insurance ($1,500) and brand work ($2,000) all land before the first invoice clears. That is why design is paid in three milestone installments, why the $3,000 Toast certification is a Q3 event, and why the brand spend is $2,000 rather than the $2,500 originally budgeted, and why the design budget is $5,000 rather than $6,000. Each of those trims exists to hold the May floor above $5,000.
3. **Run the ramp 30% slower and the trough is $5,410, not zero.** Slower sales cost you time and growth, not survival. That is the correct shape for a plan this cheap — but only if the front-loaded spending stays disciplined.
4. **First month with revenue above costs: June 2027. Capital back above $20,000: October 2027.** Both are model outputs, not aspirations, and both are gates in §11.
5. **September's revenue spike is a setup-fee month, not a step change in subscriptions.** Any month with a new paying brand will look like that. Do not annualise it.

The rule that makes $20,000 work: a $5,000 cash floor. If cash falls below $5,000 before recurring revenue passes $3,000/month (roughly 50 locations), stop spending, stop building, and sell — in that order. The model never gets close; a plan that needs luck to avoid its own floor is not a plan.

10.3 2028–2029 — when the hires land, and what gates them

Quarter	Locations	Revenue	Costs	Net	Cash	Headcount
2028 Q1	318	$71,241	$40,972	$30,269	$73,308	2 founders + contractors
2028 Q2	426	$105,585	$42,519	$63,066	$136,374	2 founders + contractors
2028 Q3	534	$142,809	$89,149	$53,660	$190,034	+ engineer (July)
2028 Q4	640	$181,567	$113,323	$68,244	$258,278	+ growth hire (October)
2029 Q1	793	$236,703	$203,266	$33,437	$291,716	founders on salary, + 2nd engineer
2029 Q2	946	$299,172	$205,857	$93,315	$385,030	5 people + support
2029 Q3	1,099	$366,076	$208,578	$157,498	$542,528	5 people + support
2029 Q4	1,250	$429,834	$211,206	$218,629	$761,157	5 people + support

Hiring gates. The model hires only when the revenue to carry the hire already exists — and the gate is written as a threshold, not a date:

- **Engineer:** hire at $35K MRR sustained for two months (model reaches it in Q2 2028; hire lands July).
- **Growth/partnerships:** hire at $50K MRR (model reaches it Q4 2028).
- **Second engineer and founder salaries:** 2029, funded from operating cash, not from the $20,000.
- **Support:** contractor at ~150 live locations (October 2027 in the model), which is exactly when support becomes a founder's whole day.

The cash floor across 2028 and 2029 is $49,835 and $263,101 respectively. There is no month in the base case where the company is at risk after mid-2027 — and that is precisely why the 2027 discipline matters: it is the only period where the plan is fragile.

10.4 Three-year summary — base case

	2027	2028	2029
Locations, end of year	210	640	1,250
Groups, end of year	15	46	92
Blended ARPU per location per month	$61	$98	$118
Exit MRR	$12,810	$62,720	$147,500
Exit ARR	$154K	$753K	$1.77M
Revenue recognized	$58,136	$501,202	$1,331,785
COGS, including support and onboarding	$7,646	$97,864	$213,918
Gross profit	$50,490	$403,338	$1,117,867
Gross margin	86.8%	80.5%	83.9%
Operating costs	$27,450	$188,100	$614,988
Operating result	**+$23,040**	**+$215,238**	**+$502,879**
Year-end cash	$43,040	$258,278	$761,157
Cash floor during year	$5,872	$49,835	$263,101

Why these numbers differ from the previous draft. Two corrections, both arithmetic:

1. **Revenue is ramp-adjusted.** The earlier draft applied each year's exit ARPU to the whole year, which inflates revenue by 4–6%. 2029 revenue is $1.33M, not $1.42M; exit ARR is $1.77M, which is the more meaningful figure anyway. Nothing about the business changed — the table got honest.
2. **Gross margin includes support and onboarding labour.** Reporting 88% while paying contractors to onboard is how plans lie to their own founders. The fully loaded number is 80.5% in 2028, recovering to 83.9% in 2029. That is a good margin for a product with this much human contact, and a bad margin for a company that tells itself it is pure software.

Founder compensation is inside "operating costs": $0 in 2027, $6,000/month total from July 2028 ($36K for the year), $100K total in 2029. That is below market in every year. Anyone reading this plan should see that number and understand that the founders are the cheapest capital in the business.

10.5 Conservative case — with its own cost line

The conservative case is not a scaled-down base case. It is a different company: Gen 1 only, no ordering module, no app, no hires, founders doing support and onboarding themselves, and a sales motion that never compounds. It is the business you get if the showcase cohort converts slowly, Toast says no to ordering, and the agency channel never produces. It is also, deliberately, the case that a two-person team can run for a decade.

	2027	2028	2029
Locations, end of year	60	334	904
Blended ARPU per location per month	$48	$48	$61
Exit MRR	$2,880	$16,032	$55,144
Exit ARR	$35K	$192K	$661K
Revenue recognized	$18,540	$126,000	$449,326
COGS — support, infrastructure, payment fees	$3,437	$31,692	$80,549
Gross margin	81.5%	74.9%	82.1%
Founding team pay	$0	$60,000 ($30K each)	$120,000 ($60K each)
Other operating costs	$15,000	$20,400	$28,800
Total costs	**$18,437**	**$112,092**	**$229,349**
Operating result	**+$103**	**+$13,909**	**+$219,977**
Year-end cash	$20,103	$34,011	$253,988
Cash floor during year	$8,678	$7,841	$36,847

Read it plainly. In the conservative case, 2027 is a wash: the company ends the year with the same $20,000 it started with, after paying for legal, design, insurance and a year of tools. 2028 pays each founder $30,000 and clears $14,000. 2029 is a real, if small, business: $449K of revenue, $120K of founder pay, $220K of profit, and $254K in the bank. Nobody gets rich, nobody goes broke, and the company never needs another dollar.

The important contrast: the conservative case has a higher cash floor ($7,841 vs $5,872) than the base case — but it arrives in early 2028, not 2027, and it arrives while both founders are drawing $2,500/month each. That is thinner than it looks: the flex in the conservative case is founder pay, not spending. If 2028 revenue lags by a quarter, the founders take nothing and the company survives; if it lags by two, they put

money in. The base case is not riskier because it is ambitious; it is riskier because it front-loads spending on a designer, certification and travel in the first five months. That is a choice, and it is the right one only if the sales ramp in §9 actually happens. If the first six weeks of 2027 produce fewer than four serious group conversations, cut to the conservative cost line immediately — do not "give it another quarter."

What the conservative case cannot do: fund Gen 2. At $449K revenue and $220K profit, the ordering module is affordable from cash flow, but there is no capital for a sales team, an audit, or a bad legal year. The conservative case buys independence, not acceleration.

10.6 The $20,000, reconciled

The earlier draft listed a use-of-funds table that added to $20,000 and implied the capital was spent in full. It is not: total 2027 cash spend is $35,150, revenue funds $23,040 of it, and the capital funds the gap — but the gap is $12,056 while the peak drawdown is $14,128, because spending leads revenue by about two months. That two-month lag is the entire reason to model monthly.

2027 cash out	Amount	When
Entity, operating agreement, terms, IP assignment	$3,000	Jan, Jul
Design, three milestone payments	$5,000	Jan–Mar
Insurance — tech E&O and cyber	$1,500	Feb
Brand, site, demo environment	$2,000	Feb
Tools and SaaS	$4,500	monthly
Travel, demos, group HQ visits	$5,600	Mar–Jun, Sep, Nov
Toast certification	$3,000	Sep
Marketing and content	$1,050	Jun–Dec
Support contractor	$4,500	Oct–Dec
Admin and miscellaneous	$1,800	monthly
Infrastructure and payment fees	$3,146	monthly
Total 2027 cash out	**$35,096**	
Funded by revenue	−$23,040	
Funded by capital	**$12,056**	
Peak capital deployed (May)	**$14,128**	

Capital deployed by month — this is the line to watch, not the budget: Jan $4,617 · Feb $10,234 · Mar $13,155 · Apr $13,956 · **May $14,128 (peak)** · Jun $13,333 · Jul $10,963 · Aug $6,724 · Sep $2,145 · Oct capital fully recovered. From November the company is funding itself and adding cash every month.

Five rules that protect the floor.

1. **$5,000 cash floor, no exceptions.** Not a "buffer," a floor. If it is breached before $3,000/month of recurring revenue, the company stops and sells.
2. **No hire before the gate.** Gates are MRR thresholds in §10.3, not calendar dates. Founders work unpaid in 2027 by design.
3. **Design is paid on delivery.** Three payments against three milestones. Never up front, never on a promise.

4. **Setup fees are not discounted.** The fee covers onboarding at two hours per location and nothing more. Waiving it for the ten showcase groups is a marketing expense, not a pricing policy.
5. **Monthly close, single page.** Cash, MRR, locations, churn, onboarding hours per location, burn. If a number is not on that page, it does not get managed.

10.7 Sensitivities — what breaks it, and by how much

Change	Effect	Survives?
2027 ramp 30% slower (147 locations, not 210)	2027 revenue $42,904; operating result +$8,689; trough $5,410	Yes, comfortably. Slower growth, same floor.
Blended ARPU 10% lower everywhere	2029 revenue $1.21M (−$127K); operating result $380K	Yes. The model is not ARPU-fragile at these prices.
Group churn 2.5%/month instead of 1.5%	LTV falls to ~$3,500; LTV:CAC ~2.9x; 2029 locations materially lower	Marginal. Still investable, but the growth story weakens and CAC discipline becomes the whole game.
Setup fee raised to $2,500	+$31K revenue in 2028, +$46K in 2029, no cost change	Improves. Do it unless the first ten conversations say otherwise.
Toast denies ordering access entirely	2028 revenue $363K, 2029 revenue $773K, 2029 operating result −$40K at base-case cost structure	**No — at base-case costs.** The fix is immediate: fall back to the conservative cost line. This is why that case is printed with its own numbers.
Onboarding runs 4 hours/location	Setup fee is −$1,140 per brand; 2028 gross margin falls ~4 points	Tolerable, but it converts a software business into an agency. Automate it or cap it.
Support tickets double after 150 locations	Support contractor becomes a $5,500/month line; 2028 margin −3 points	Yes. This is normal SaaS scaling cost, not a crisis.

The asymmetry is worth stating: the base case can absorb slower sales and lower prices. It cannot absorb **Toast denying ordering access while spending at base-case levels** — because the 2028–29 cost line assumes ordering revenue exists. That single dependency is why §7 is the critical path and why the conservative cost line is a switch to flip, not a scenario to admire.

10.8 What the model cannot tell you

It cannot tell you whether restaurant groups will pay $59 per location to fix a menu problem they have lived with for a decade. It cannot tell you whether Toast approves the partner application, or at what revenue share. It cannot price the value of the case studies the showcase cohort produces, and it cannot model the founder who quits in month fourteen. Those are the risks in §13, not spreadsheet cells.

What it can tell you is narrower and more useful: **at these prices, these costs, and this ramp, the company survives its own plan with $5,900 in the bank at the worst moment, and never needs another dollar to reach $1.3M of revenue.** If those assumptions are wrong by 10%, it still works. If they are wrong by half, the conservative case still works. If Toast says no, you cut costs and the conservative case works. That is what "funded" means: not that the plan is right, but that being wrong is survivable.

11. Timeline and milestones

When	Milestone
Jan 2027, week 1	Toast partner application submitted. Entity formed; $20,000 paid in; operating agreement, vesting, and IP assignment signed before the money moves (§15)
Jan–Mar 2027	Finalize product vision, this business plan, pitch deck, and pricing; publish pricing publicly in month 1; build the 40-group target list; ship the CSV/Sheets import bridge; WCAG and price-accuracy terms specced before the first customer
Mar–Jun 2027	Sign and onboard the 10 showcase groups (Gen 1.0 live: custom menus, order-ready boards, location picker) — at least 6 of 10 paying (§9)
~May 2027 (day 120)	Go/no-go gate: Toast partner approval in hand or clearly in process — otherwise redirect to multi-POS + import path or stop (§7, §14)
Jun–Oct 2027	Cash gates: revenue above costs by June 2027; capital fully recovered by October 2027 (§10.2). If cash falls below $5,000 before recurring revenue passes $3,000/month, stop and sell
H2 2027	Case studies published; showcase conversion to full price; 5 additional full-price groups; partner certification alpha/beta; agency channel producing its first groups
Oct–Dec 2027	Multi-unit sales push: 2–3 groups at 10+ locations on annual terms — this is what proves the actual thesis
2028	Gen 2.0 — custom online ordering launches (gated on Toast ordering-partner certification); Partner Connect listing live; second POS adapter (Square) by ~month 18. Base case: 640 locations, $501K revenue, $753K exit ARR. Engineer hired at $35K MRR, growth hire at $50K MRR (§10.3)
2029	Gen 3.0 — custom branded mobile app and e-commerce; enterprise push at 25+ location groups. Base case: 1,250 locations, $1.33M revenue, $1.77M exit ARR, $503K operating result (§10.4). Decision point: raise to accelerate, or run as a profitable business

12. Team and operations

Two founding partners (names and role split to be completed in the operating agreement — the plan deliberately does not assume them). The work splits into four functions that must each have a named owner from day one: product/engineering, Toast integration and certification, sales/operator relationships, and onboarding/support. With two people, each owns two — write down which, because “we both do sales” means nobody does support during a Friday dinner rush when a board goes wrong.

Operating posture: remote-first, asynchronous, built to be run from anywhere — including across time zones — with support coverage matched to US restaurant service hours (lunch and dinner peaks, Eastern through Pacific). Support trigger: at roughly 150 live locations, support becomes a founder’s whole day — budget a part-time support contractor (~$2,500/mo) from that point, funded from revenue.

Metrics that matter (monthly): locations live · net new locations · revenue per location · group logo churn · gross margin per location · CAC by channel · onboarding hours per location · publish success rate · last-known-good activations (a leading indicator of upstream fragility) · support tickets per 100 locations.

13. Risks and mitigations

Toast denies partner access (fatal if unmanaged). No partner status means no clean, stable menu feed at scale, and workarounds (scraping the Toast admin, weekly CSV exports) are fragile and likely a terms-of-service problem. Mitigation: apply in week one; day-120 go/no-go gate (§7); POS-agnostic architecture; the import bridge keeps early revenue possible without betting the company on the gate.

Marketplace economics. If a ~30%-style revenue share applies, margin compresses materially. Mitigation: get the actual terms before scaling; price for the share from day one; keep the direct-sold mix above 50% of revenue.

Toast ships it natively. Toast already bundles websites and ordering and sells Delphi boards; a free “brand kit + menu publishing” release would compress Garnsh’s pricing. Mitigation: win on publishing discipline and multi-surface reach; be multi-POS by month ~18; own channels Toast doesn’t control (operator-language search, agencies).

Certification timeline slips. Gen 2 revenue depends on a process Toast controls. Mitigation: Gen 1 must be a real business on its own (it is, at ~70 locations); never pre-sell ordering dates to customers.

Group churn is lumpy. Losing one 40-location group is losing 40 locations in a day. Mitigation: annual contracts at 10+ locations, quarterly business reviews, and a hard rule that no single group exceeds 15% of revenue by 2028.

Liability for what Garnsh renders. A wrong price or an allergen claim on a published menu is a legal exposure, not a typo. Mitigation: contract makes Toast the system of record; every surface shows an “as of” freshness timestamp; Garnsh never renders nutrition or allergen claims; tech E&O insurance from month one.

Accessibility (ADA/WCAG) exposure. Public menu pages are exactly the kind of surface plaintiffs’ firms scan. Mitigation: WCAG 2.1 AA as a ship gate for all four surfaces, plus a published accessibility statement.

Sales cycle length. Restaurant groups buy slowly and seasonally (nobody signs during December or during an opening). Mitigation: the 40-conversation pipeline math in §9, the two-location pilot motion, and showcase pricing that removes the budget objection for the first cohort.

Thin capitalization. $20,000 leaves no room for a paid engineer, a SOC 2 audit if a big group demands one, or a legal fight. Mitigation: the use-of-funds table protects a certification reserve and a buffer; Gen 2/ enterprise security requirements are scoped only after revenue exists to fund them.

Founder concentration. Two people, one of whom likely holds the whole codebase. Mitigation: contract designer early, document everything, no single-person deployment path.

14. Kill criteria

Decided in advance, in writing, so the decision is not made emotionally at month nine:

No Toast partner approval (or clear in-process path) by day 120 → pivot all effort to the multi-POS + agency-channel path, or stop.

Fewer than 10 paying locations by day 180 → the ICP or the price is wrong. Do not add features; re-interview the 20 people who said no.

Multi-unit logo churn above 3% per month once past 25 multi-unit locations → the product is not embedded in their workflow. Stop marketing spend and fix onboarding.

CAC payback above 18 months on any channel after $5,000 spent on it → kill that channel, permanently.

Gross margin below 75% at 100 locations → unit economics are broken by support cost; re-price or automate onboarding before growing.

Cash below $5,000 before recurring revenue passes $3,000/month → stop. Not "cut back" — stop building, stop spending, and sell what exists (§10.2). The model's floor is $5,872; a plan that needs luck to clear its own floor is not a plan.

15. Founder decisions and the partnership checklist

Decisions still needed

Partner names, equity split, and who owns which of the four functions in §12.

Entity type and state of formation (the notes say “legalize through partner” — clarify what that means: whose name, which state). Recommendation from the review draft, adopted as the default: an LLC taxed as a partnership at this scale — cheap, flexible, no double taxation; elect S-corp treatment later when there is profit worth optimizing, or convert to a Delaware C-corp if outside capital is ever raised.

Correct the showcase-phase year in the notes (2026 → 2027) and confirm the Mar–Jun 2027 window is realistic against whoever is building Gen 1.

Validate §8 pricing with at least three friendly operators before the pitch deck locks it in.

Confirm the Toast strategy in §7 explicitly: application in week one, day-120 gate, in parallel with showcase sales.

Decide the growth-direction question in §4 (up to 25+ groups vs. down to 3–9 + multi-POS first) — scheduled for the H2 2027 review, with data.

Confirm whether the current demo site’s scope (publishing only, no ordering) is the official Gen 1 promise to customers. The notes’ Gen 1 list and the site agree — keep them that way.

Before the $10,000 moves (checklist)

A 50/50 two-person company funded with $10,000 each is the most common structure in software and the most common structure to fail. All of the following are cheap in January 2027 and unaffordable later:

Operating agreement, signed — decision rights (who owns product, who owns sales), expense policy, and a deadlock clause (mediation, then buy-sell). A deadlock clause is not pessimism; it is the difference between a resolved disagreement and a dissolved company.

Vesting, even for founders — four-year vest, one-year cliff, applied to both partners. Without it, a partner who leaves in month four keeps half the company forever.

IP assignment from both partners to the entity — critical and routinely missed. Any code, design, or copy written before the entity existed belongs personally to whoever wrote it unless assigned. The current demo and site need an explicit assignment.

Buy-sell / right of first refusal with a valuation formula agreed while everyone is friendly.

Trademark — search and file “Garnsh” (USPTO, roughly $250–$350 per class; classes 9 and 42) before spending further on brand assets.

Separate books from day one — business bank account, accounting software, no commingling. It matters at tax time and in any future diligence.

Insurance in month one — tech errors-and-omissions + cyber (~$1,500–$3,000/yr at this stage).

Contractor agreements with IP assignment for any designer or engineer who touches the product.

Sources and verification notes

Toast Q3 2026 results (Toast investor relations / Business Wire, Nov 3, 2026): ~189,000 total locations (+21% YoY), ARR $2.5B, ~8,500 net new locations in the quarter.

Toast partner program structure (Toast developer documentation and 2026 partner-API reporting): closed ecosystem, ~eight-stage process (application → vetting → agreement → sandbox build → certification → alpha at 1 location → beta at 3–5 locations → Partner Connect listing); partner fees unpublished; ~30% ordering revenue share is from 2019 reporting and is not treated as current.

Toast standard API access (Toast developer guide, 2026): read-only, per-restaurant credentials included with Restaurant Management Suite Essentials for US customers.

Toast menu-to-website access (verified Nov 7, 2026): Toast's own support documentation shows the website menu channel is "Websites View-Only" — the menu displays on a Toast Website only, view only, not orderable — and that Toast Online Ordering and Toast Local menus cannot differ. Third-party 2026 guides confirm the Menus API's production credentials are issued only to accepted partner-program vendors ("Anyone can read the docs. Almost no one can call the API"), and that standard API access is GET-only, per-location, Menus V2, and positioned for reporting rather than ordering or website publishing. A WordPress Toast-menu plugin's own FAQ confirms even it requires the account to have Partner API access enabled, arranged through a Toast representative.

Competitor pricing: published-price roundups, October 2026 (ChowNow $229–$449/mo + setup; Popmenu $159–$499/mo; Owner.com $249/mo + 5% or $499 flat; Lunchbox enterprise ~$300–$499/mo per location per product; BentoBox pricing unpublished and Clover-only as of 2026). Popmenu setup (~$1,300) and UpMenu ranges cited in the review draft are reported, not published, and are not used in this plan's tables.

US restaurant counts: industry reporting citing 700,000+ US eating and drinking establishments (2024–2026).

Product scope, roadmap, timeline, capitalization, and target market: founders' working notes shared November 7, 2026, and garnsh.vercel.app as read the same day.

Independent review draft ("v1.1," November 7, 2026): source of the day-120 gate, kill criteria, partnership checklist, conservative financial case, agency-channel and showcase-payment amendments, and the alternative pricing ladder and growth-direction argument — each adopted, adapted, or explicitly deferred where noted in the text.
